## Vulnerabilities by Host

---

184.73.185.129

## Scan Information

Start time: Sat Jul 10 02:06:34 2021  
End time: Sat Jul 10 02:27:28 2021

## Host Information

DNS Name: ec2-184-73-185-129.compute-1.amazonaws.com  
IP: 184.73.185.129  
OS: AIX 5.3

## Vulnerabilities

10756 - Apple Mac OS X Find-By-Content .DS\_Store Web Directory Listing

## Synopsis

It is possible to get the list of files present in the remote directory.

## Description

It is possible to read a '.DS\_Store' file on the remote web server.

This file is created by MacOS X Finder; it is used to remember the icons position on the desktop, among other things, and contains the list of files and directories present in the remote directory.

Note that deleted files may still be present in this .DS\_Store file.

## See Also

<https://support.apple.com/en-us/HT1629>  
<https://helpx.adobe.com/dreamweaver/kb/remove-ds-store-files-mac.html>  
<http://www.greci.cc/?p=10>

## Solution

- Configure your web server so as to prevent the download of .DS\_Store files

- Mac OS X users should configure their workstation to disable the creation of .DS\_Store files on network shares.

## Risk Factor

## 70658 - SSH Server CBC Mode Ciphers Enabled

### Synopsis

The SSH server is configured to use Cipher Block Chaining.

### Description

The SSH server is configured to support Cipher Block Chaining (CBC) encryption. This may allow an attacker to recover the plaintext message from the ciphertext.

Note that this plugin only checks for the options of the SSH server and does not check for vulnerable software versions.

### Solution

Contact the vendor or consult product documentation to disable CBC mode cipher encryption, and enable CTR or GCM cipher mode encryption.

### Risk Factor

Low

### CVSS v2.0 Base Score

2.6 (CVSS2#AV:N/AC:H/Au:N/C:P/I:N/A:N)

### CVSS v2.0 Temporal Score

### Plugin Information

Published: 2013/10/28, Modified: 2018/07/30

### Plugin Output

tcp/22/ssh

```
The following client-to-server Cipher Block Chaining (CBC) algorithms
are supported :
```

```
3des-cbc  
aes128-cbc  
aes192-cbc  
aes256-cbc  
blowfish-cbc  
cast128-cbc
```

The following server-to-client Cipher Block Chaining (CBC) algorithms are supported :

```
3des-cbc  
aes128-cbc  
aes192-cbc  
aes256-cbc  
blowfish-cbc  
cast128-cbc
```

### Synopsis

It is possible to obtain the version number of the remote Apache HTTP server.

### Description

The remote host is running the Apache HTTP Server, an open source web server. It was possible to read the version number from the banner.

Version  : unknown
backported : 0
```

## 39520 - Backported Security Patch Detection (SSH)

### Synopsis

Security patches are backported.

### Description

Security patches may have been 'backported' to the remote SSH server without changing its version number.

Banner-based checks have been disabled to avoid false positives.

Note that this test is informational only and does not denote any security problem.

### Plugin Output

tcp/22/ssh

```
Give Nessus credentials to perform local checks.
```

### Synopsis

It was possible to enumerate CPE names that matched on the remote system.

### Description

By using information obtained from a Nessus scan, this plugin reports CPE (Common Platform Enumeration) matches for various hardware and software products found on a host.

Note that if an official CPE is not available for the product, this plugin computes the best possible CPE based on the information available from the scan.

### Plugin Output

tcp/0

```
The remote operating system matched the following CPE :
```

```
cpe:/o:ibm:aix:5.3 -> IBM AIX 5.3
```

```
Following application CPE's matched on the remote system :
```

```
cpe:/a:apache:http_server:
```

```
cpe:/a:openbsd:openssh:7.4 -> OpenBSD OpenSSH 7.4
```

### Synopsis

It is possible to guess the remote device type.

### Description

Based on the remote operating system, it is possible to determine what the remote system type is (eg: a printer, router, general-purpose computer, etc).

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2011/05/23, Modified: 2011/05/23

### Plugin Output

tcp/0

```
Remote device type : general-purpose  
Confidence level : 65
```

## 10107 - HTTP Server Type and Version

### Synopsis

A web server is running on the remote host.

### Description

This plugin attempts to determine the type and the version of the remote web server.

### Solution

n/a

### Risk Factor

None

### References

### Plugin Output

tcp/80/www

```
The remote web server type is :  
Apache
```

## 12053 - Host Fully Qualified Domain Name (FQDN) Resolution

### Synopsis

It was possible to resolve the name of the remote host.

### Description

Nessus was able to resolve the fully qualified domain name (FQDN) of the remote host.

### Solution

n/a

### Risk Factor

None

### Plugin Information

Published: 2004/02/11, Modified: 2017/04/14

### Plugin Output

tcp/0

```
184.73.185.129 resolves as ec2-184-73-185-129.compute-1.amazonaws.com.
```

### Synopsis

Some information about the remote HTTP configuration can be extracted.

### Description

This test gives some information about the remote HTTP protocol - the version used, whether HTTP Keep-Alive and HTTP pipelining are enabled, etc...

This test is informational only and does not denote any security problem.

### Solution

n/a

### Risk Factor

None

## 117886 - Local Checks Not Enabled (info)

### Synopsis

Local checks were not enabled.

### Description

Nessus did not enable local checks on the remote host. This does not necessarily indicate a problem with the scan. Credentials may not have been provided, local checks may not be available for the target, the target may not have been identified, or another issue may have occurred that prevented local checks from being enabled. See plugin output for details.

This plugin reports informational findings related to local checks not being enabled. For failure information, see plugin 21745 :

'Authentication Failure - Local Checks Not Run'.

The following issues were reported :

```
- Plugin      : no_local_checks_credentials.nasl
  Plugin ID   : 110723
  Plugin Name : Target Credential Status by Authentication Protocol - No Credentials Provided
  Message     :
  Credentials were not provided for detected SSH service.
```

### Synopsis

---

It is possible to determine which TCP ports are open.

### Description

---

This plugin is a SYN 'half-open' port scanner. It shall be reasonably quick even against a firewalled target.

Note that SYN scans are less intrusive than TCP (full connect) scans against broken services, but they might cause problems for less robust firewalls and also leave unclosed connections on the remote target, if the network is loaded.

### Solution

---

Protect your target with an IP filter.

### Risk Factor

---

None

### Plugin Information

---

Published: 2009/02/04, Modified: 2021/04/20

### Plugin Output

```

### Synopsis

---

This plugin displays information about the Nessus scan.

### Description

---

This plugin displays, for each tested host, information about the scan itself :

- The version of the plugin set.
- The type of scanner (Nessus or Nessus Home).
- The version of the Nessus Engine.
- The port scanner(s) used.
- The port range scanned.
- The ping round trip time
- Whether credentialed or third-party patch management checks are possible.
- Whether the display of superseded patches is enabled
- The date of the scan.
- The duration of the scan.
- The number of hosts scanned in parallel.
- The number of checks done in parallel.

tcp/80/www

```
A web server is running on this port.
```

### Synopsis

Nessus was able to find common ports used for local checks, however, no credentials were provided in the scan policy.

### Description

Nessus was not able to successfully authenticate directly to the remote target on an available authentication protocol. Nessus was able to connect to the remote port and identify that the service running on the port supports an authentication protocol, but Nessus failed to authenticate to the remote service using the provided credentials. There may have been a protocol failure that prevented authentication from being attempted or all of the provided credentials for the authentication protocol may be invalid. See plugin output for error details.

Please note the following :

- This plugin reports per protocol, so it is possible for valid credentials to be provided for one protocol and not another. For example, authentication may succeed via SSH but fail via SMB, while no credentials were provided for an available SNMP service.
- Providing valid credentials for all available authentication protocols may improve scan coverage, but the value of successful authentication for a given protocol may vary from target to target depending upon what data (if any) is gathered from the target via that protocol. For example, successful authentication via SSH is more valuable for Linux targets than for Windows targets, and likewise successful authentication via SMB is more valuable for Windows targets than for Linux targets.
